of loss about two times more intensely than we feel the pleasure of gain. It’s a concept called loss aversion, discussed by Daniel Kahneman and Amos Tversky in their 1984 study ‘Choices, Values, and Frames’, then later in Kahneman’s book *Thinking, Fast and Slow*.

The relationship between how often you check your portfolio and how much money you make is documented well; the more often you check your portfolio, the more likely you are to see a loss.

An investor who checks their stocks more often, for example daily instead of quarterly, has an increased risk of losing more money, Kahneman observed. You’re more likely to act on what you see.

This is one of the key strategies to having a successful investing portfolio. How often should one check their portfolio? Technically, as little as possible. Investors in training usually check their portfolio once every month to once every quarter. If you’re currently checking daily, start off with monthly to get into the habit of checking it less, and then eventually move this to quarterly.

This doesn’t mean only invest once a month or once a quarter, but have automatic systems set up that invest for you, so that you don’t have to check your stocks as often.

Investing information has never been more accessible, but that doesn’t mean investors should constantly access it. Female investors are able to control this urge to stay updated on the small movements of their portfolios and end up being better off for it.

#6: Invest for the long term; don’t trade as often

Female investors increase their earnings by trading (i.e. buying and selling) less frequently. Men are 35 per cent more likely to trade stocks than women.

During periods when there is a lot of volatility in the world, such as during presidential elections, ebola outbreaks or a debt crisis, the number of trades on platforms increase — however, women continue to trade less frequently than men, leaving them better off in the long term.
