The top of the pattern is at turn A. The stock only reaches the price of A less than half the time (bull markets) and less than a third of the time in bear markets.

Hopefully, you can use these statistics to help decide if a Gartley is worth trading. Your situation may be different, and other indicators may help you select patterns that will outperform.

Sample Trade

My brother called last night, and we chatted about stocks. His holding in Netflix jumped upward on good quarterly numbers. "How should I trade it?" he asked.

"In about a week to ten days, it'll peak. Sell it then." That's what I told him. It reminds me of a trade Jacob made. See **Figure 38.4**.

Jacob's computer flagged the Gartley (XABCD) and showed him where turn D was expected to appear. Looking to the left of point D, he saw points B and E were near the same price. "That's support," he told me. Except for the plunge at X, the rest of the pattern (EBD) seemed to be resting on a flat table.

Table 38.3 Price Move after Pattern End

Description	Bull Market	Bear Market
How often does price turn at D?	90%	86%
How many rise to point A?	45%	31%
How many rise to point B?	98%	98%
How many rise to point C?	59%	49%
