In other types of chart patterns, we've seen bear markets have a higher speed for both up and down breakout directions, often twice as fast. The velocity is not faster than a speeding bullet, nor can it leap tall buildings, but the difference between bull and bear markets is interesting.

**How many change trend?** I included this gauge to help determine if price rises far enough after the breakout. Patterns in bear markets do well, but the bull market is light on performance. Still, having half of the patterns see price rise more than 20% is a good thing.

**Table 70.3** shows failure rates. For example, in bull markets 30 extended V-bottoms, or 10%, failed to see price rise more than 5% after an upward breakout. Another 44, for a total of 74 or 26% of all extended V-bottoms I looked at, failed to rise more than 10% after the breakout.

**Table 70.3** Cumulative Failure Rates

| Maximum Price Rise (%) | Bull Market | Bear Market |
|---|---|---|
| 5 (breakeven) | 30 or 10% | 10 or 7% |
| 10 | 44 or 26% | 18 or 21% |
| 15 | 32 or 37% | 13 or 30% |
| 20 | 28 or 47% | 12 or 39% |
| 25 | 24 or 55% | 12 or 48% |
| 30 | 18 or 61% | 15 or 59% |
| 35 | 7 or 64% | 16 or 71% |
| 50 | 27 or 73% | 12 or 80% |
| 75 | 37 or 86% | 17 or 93% |
| Over 75 | 41 or 100% | 10 or 100% |

Another example: Almost half the patterns (47%) failed to see price rise more than 20%. That's in bull markets. Bear markets have lower failure rates.

**Table 70.4** shows breakout-related statistics.

**Breakout direction.** As I mentioned, not all of the patterns I catalogued broke out upward. Some had downward breakouts, but they were too few to
