Width. In three of four contests (columns), wide patterns see better post-breakout performance than do narrow ones. The one exception happens in bear markets after upward breakouts.

I found it odd that bear market, up breakout percentages for height and width are the same. I checked my spreadsheet, and the information is correct.

To use width as an indicator, compute the time from the end of the pattern to the start (in calendar days, not price bars). If the result is more than the median listed in the table, then you have a wide pattern.

Height and width combinations. Table 11.5 shows the performance results after combining the characteristics of height and width. Most of the time, tall and wide patterns show the best performance. In bear markets, after downward breakouts, short and wide patterns outperform. That's probably a statistical fluke, and the percentages are close, anyway.

Table 11.6 shows volume-related statistics.
