Any money not spent on the usual bills would not earn much in a savings account, but in this scenario, the overall life of the mortgage is reduced. Translation? You are ahead of the game. It is sort of like an automated way of paying off the mortgage – you may have good intentions, but extra money in the checkbook is often spent on coffee or other miscellaneous items. With the accelerator account, the extra money is applied to your mortgage before you have a chance to spend it.

If you do need that extra money, it is yours. The account is a line of credit or home equity loan so you don't have to do anything; you have ready access. This accelerator loan is a terrific product. There are currently two companies that offer this loan in the US. For more information, you can check it out at: http://articles.moneycentral.msn.com/Banking/HomeFinancing/ANewWayToPayOffYourHouse.aspx.

A similar product is the Money Merge Account. Combining your checking and savings accounts with an advanced line of credit, this system exists to aid you in paying off your mortgage in one-third to one-half the regular time. There is no refinancing involved, no change in the amount of your monthly payments.

Check out this example, which is explained in more detail on www.unitedfirstfinancial.com: You have a 30-year, $136,000 mortgage at 5.25%. If you paid each month for 30 years, you would pay $270,784 – nearly twice the cost of the home. Standard operation for many folks, and the banks are quite happy with that status quo. The Money Merge Account program, simply by applying money to the principal all the time, can help repay the same mortgage in just over 11 years. Total repayment of $181,217 – an incredible savings of $89,566! Same mortgage, same interest rate, little or no changes in your monthly expense, but wow, what a nice sum.

It is amazing what putting money against the principal balance can do. Even as little as $15 every two weeks applied to your mortgage can cut one and a half years off! Now that is a great incentive! Every little bit matters.
