[Table 66.5](#) shows pattern size statistics.

Height. Tall patterns perform better than short ones under all market conditions and breakout directions except for the right column (bear market/down breakout, where it's a tie).

However, for the best performance, select a tall pattern, as measured from the highest minor high to the lowest minor low in the triangle. Divide the height by the breakout price and compare it to the median in the table. If your result is above the median, then you have a tall pattern.

Width. Wide patterns also perform better, except for triangles in bear markets with downward breakouts (again, that column shows a tie). I used the median length shown in the table as the separator between wide and narrow. I'm impressed that the median width across the four columns is about the same: 35 to 37 days.
