2012 Example

Figure 62.5 shows a chart from 2012 with another three peaks and domed house pattern. The base is at 1, 2, and price meanders up to the first peak of three, 3. This rise is unusually long, and the three peaks are too close together. Peaks 3 to 7 should be separated by 8 months, but these total about 2 months long. I don't know how Lindsay would justify that. He might say that this is not a three peaks and domed house pattern. That's possible.

Figure 62.5 The absence of the test of point 10 suggests to use turn 4 or 6 to predict the appearance of the domed house.

However, the separating decline from 7 to 10 sets off the three peaks quite clearly. Points 11 to 14 appear as a tight congestion region and not a test of 10 at all. Does that mean we should use points 6 or 4 in the measure to predict the appearance of the domed house? Recall peak 23 should be 7 months and 8 to 10 days from the bottom at 14. Since we have no 14, let's use point 6 and see what it says (which is a method he used in one of his charts).

According to my spreadsheet, I found the number of days between 1 January 2012 and 8 July 2012 (that is 7 months and 8 days) and added that to the date of valley 6 (10 April 2012). What's the result? Answer: 16
