Was this change an immediate "sell signal?" As *The Elliott Wave Theorist* reiterated, "This is a change in psychology typical of the 'point of recognition.' Emerging enthusiasm, however, is *not* an immediate sell signal. The resulting publicity is drawing in more public participants, which adds more fuel to the trend."

The summer of 1986 displayed numerous indications of an emerging enchantment with the stock market. Newspaper clippings from June, July and August told the story. "Money," said a media expert in *The Wall Street Journal*, "is becoming the new sex," a source of "endless fascination." "A new crop of celebrities will be picked from business," said another. Even the new board games reflected the focus on finance. "Last year it was murder; this year it's money," said a New York merchandise buyer in the August 28, 1986 WSJ. New game titles that summer included "Condomoneyum," "Go For It," "Your Money," and "The Bottom Line." Then the media joined in. "Television is suddenly bullish on business news," said a July 30, 1986 article entitled "Lineup of TV Business Shows Expands." "Local Stations are Giving Business the News...And the Viewers Like It," read another headline. Financial News Network (now CNBC) became standard viewing not only in trading rooms, but in New York bars. After decades of nearly total ignorance of business, television began flooding the market with business and market news. Why? Because Cycle wave V of Supercycle (V) had passed the point of recognition, and the public demanded it. In December 1986, *USA Today* proclaimed, "A New Breed is Bullish On the Market," noting that 57% of the new stock investors since mid-1983 were women. Whatever their age or sex, a new breed is a new breed, and it takes a new breed to recreate the follies of the past.

Though the bullish fever was beginning to take hold, it had a long way to go even at that juncture. On November 7, at the end of the late 1986 consolidation, which included two record down days in terms of Dow points, *The Elliott Wave Theorist* concluded as follows:

> *Long term* sentiment measures are still in an extremely bullish position. These indicators argue powerfully in favor of the Elliott Wave conclusion that the Dow will *double yet again* before the bull market is over.

In fact, the Dow has more than doubled from that point, though by a circuitous route. The bull market roared into August 1987 and then crashed. The crash prompted analogies to 1929 in the press,
