Breakout volume. I have read that you should only buy double bottoms if the breakout occurs on heavy volume. Is that true? I found a large six-percentage-point difference between patterns with breakout volume above the 30-day average compared to those with light volume. Even so, I don't think it's true, but that's my opinion. Volume (in other types of chart patterns) usually doesn't give the kind of boost many expect.

Table 27.7 shows how often price reaches a stop location. I looked back at Adam & Adam double bottoms and found they have nearly the same percentages as Adam & Eve patterns. Coincidence or deep state plot?

If you place a stop-loss order at the bottom of the pattern, the stop will hit 3% of the time, on average. However, the loss you may suffer could be quite large. Choose a closer stop location, and the potential loss decreases, but the chance of being stopped out increases. In other words, you have to find a stop location that works for you and your trading style.

Table 27.6 Volume Statistics

Description	Bull Market
Volume trend	70% down
Rising volume trend performance	41%
Falling volume trend performance	44%
Heavy breakout volume performance	45%
Light breakout volume performance	39%

Table 27.7 How Often Stops Hit

Description	Bull Market
Pattern top	76%
Middle	21%
Pattern bottom	3%
