
This visualization immediately shows which stocks outperformed or underperformed, helping identify relative strength—a concept central to many trading strategies.

Scatter Plots: Finding Relationships

Scatter plots reveal relationships between two variables, helping traders identify correlations and potential predictive relationships.

```
# Create a DataFrame with S&P 500 and Apple returns
spy_data = yf.download('SPY', start='2022-01-01', end='2023-01-01')
spy_data['Returns'] = spy_data['Adj Close'].pct_change()

# Merge the data
combined = pd.DataFrame({
    'Apple': apple['Returns'],
    'SP500': spy_data['Returns']
}).dropna()

# Create a scatter plot
plt.figure(figsize=(10, 10))
plt.scatter(combined['SP500'], combined['Apple'], alpha=0.5)
plt.title('Apple Returns vs. S&P 500 Returns (2022)')
plt.xlabel('S&P 500 Daily Return')
plt.ylabel('Apple Daily Return')
plt.axhline(0, color='grey', linestyle='--', alpha=0.3)
```
