
Finally, Exhibit 6.19 shows the spending path for the ten strategies beginning from 1946, a more typically average year to retire. For this retirement year, the variable strategies experienced a reduction in spending in the early part of retirement that was overcome later in retirement when spending typically increased.

By year thirty, most strategies experienced spending at close to the same real level as it started. The ratcheting strategy is the only strategy with significantly higher spending at year thirty. The modified RMD rule strategy experienced the highest spending in the middle part of retirement, but with reductions in the portfolio balance that led to lower spending by year thirty. Remaining wealth after thirty years is the lowest with the
