of these statistics. This time, it is the Kondratieff cycle, which is bearish, that is being ignored, and it is being *entirely* ignored. Aside from *The Elliott Wave Theorist* and *The P.Q. Wall Forecast* (Box 1558, New Orleans, LA 70175), not a soul publishing today even mentions the Kondratieff cycle, which was all the rage in the late 1970s and early 1980s. Most believe that it is a fantasy, and those who once toyed with the idea think that it has been "disproved" because there was no depression when others called for one ten-plus years ago. It is thus likely to be the cycle that actually applies, not despite the fact that people are ignoring it, but because they are.

The Kondratieff cycle is due to bottom in 2003, leaving only eight down years remaining in the 54-year cycle. With substantial downside pressure being thus applied to the market, the smaller 4-year cycle, which has just bottomed in December 1994, should peak early. The market should advance just far enough and high enough to assure analysts that their bullish two-year outlook is correct, just before the rug is pulled. If 1995 is down, it will be the first "5" year since the Decennial Pattern was identified seventy years ago and the first third year in a Presidential term since World War II to produce a net decline in stock prices. Despite these odds, it once again appears prudent to challenge conventional assumptions, this time in the other direction.

In 1984, the widespread bearish assumptions merely resulted in lost profits, as a powerful Primary third wave lay just ahead. Today, the widespread bullish assumptions are set up to produce devastating losses, as a Grand Supercycle bear market lies just ahead.

THE NEXT MAJOR STOCK MARKET BOTTOM

The next 4- and 8-year cycle lows are due in 1998. The next 12-year cycle low is due in 1998. The next 16-to-20-year cycle low is due in 1998-2002. The 16.6-16.9-year turning point cycle is due in 1999. The next 18-year cycle low is due in 2000. The next 20-year cycle low is due in 2002. The next Decennial Pattern low is due in 2002-2004. The Kondratieff/Benner cycle low is due in 2003. The next 4-year cycle is due to bottom in 2004. Thus, regardless of whether the stock market tops out in 1995, cycles strongly suggest a major low in the **1998-2004** period.
