Glossary

The statistics in this book use hundreds or thousands of *perfect trades* (buying at the breakout price and selling at the ultimate high or ultimate low). The likelihood of duplicating that in actual trading is zero. Thus, do not expect your trades to perform as well as the "average" statistics in this book. You may do better (or worse). Rather, use the statistics as tools to help gauge how well the pattern you are about to trade will perform when compared to other chart patterns in this book.

The following tables appear in most chapters. X is the chapter number (such as Table x.2 where x is the chapter number). Beside each table entry is an explanation.

Following that is a glossary of terms. Time is measured in calendar days, not price bars or trading days unless otherwise noted.

Often in this book, I'll write something like "compared to all other chart pattern types." That does not include Fibonacci patterns or those on a time scale longer than daily.

Results Snapshot (sorted by breakout direction and market condition)
