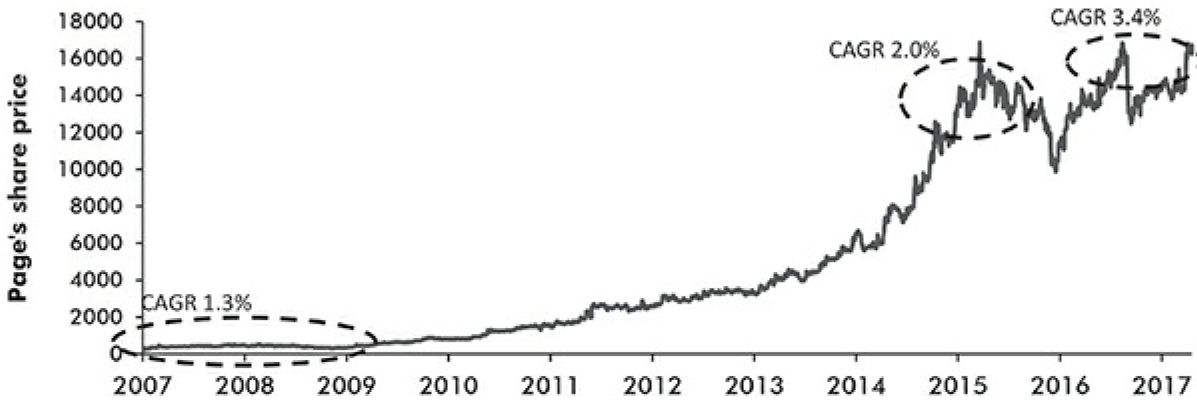
Exhibit 17: Page's stock price has compounded at an impressive 45 per cent per annum between March '07 and June '17



Source: Bloomberg, Ambit Capital

However, the chart above also highlights that over the past ten years, there have been several extended time periods when Page's share price did not generate impressive returns (circled in the exhibit above). In spite of being flat over these periods, Page has performed so well in the remaining period that the ten-year compounded annualized investment return from the stock (from March 2007 to June 2017) is 45 per cent. At its simplest, this is why the concept of investing for longer time horizons works—once you have identified a great franchise and you have the ability to hold on to it for a long period of time, there is no point trying to be too precise about timing your entry or your exit. As soon as you try to time that entry/exit, you run the risk of 'noise' rather than fundamentals driving your investment decisions.

Transaction costs: By holding a portfolio of stocks for over ten years, a fund manager resists the temptation to buy/sell in the short term. This approach reduces transaction costs that add to the overall portfolio performance over the long term. We illustrate this with an example. Assume that you invest US$100 million in a hypothetical portfolio on 30 June 2006. Assume further that you churn this portfolio by 50 per cent per annum (implying that a typical position is held for two years) and this portfolio compounds at the rate of Sensex Index. Assuming a total price impact cost
