The uncertainty trope arises not when things are uncertain—and *they ALWAYS are uncertain*. Rather, it comes up during those all-too-rare instances when we mortals briefly acknowledge reality. When it passes, we all manage to go back to our previously constructed artificial reality.

In the film *The Matrix*, Neo (played by our *John Wick* friend, Keanu Reeves) is faced with the choice of choosing the red pill or the blue pill. Take the blue pill and go back to your little bubble of delusion. *The Matrix* was a Hollywood fantasy where Neo takes the red pill, and all is revealed. In the real world, the blue pill dominates. Most of us prefer the comfortable fantasy that we actually know what is going on. (Narrator: We don't.)

Pundits may hate uncertainty—it tends to make them look foolish—but markets harbor no such bias. In fact, markets thrive on uncertainty. It is their reason for being.

Your artificial construct beckons…

Okay, now that we better understand what uncertainty is (and how we lie to ourselves about it), some advice as to what to do during market crashes might be useful. That's next.
