**Average time to close the gap.** Compared to breakaway gaps, continuation gaps close quicker, as one might guess (because breakaway gaps appear near the trend start but continuation gaps appear in the middle). The longest takes almost a year to close.

**Percentage closed.** I show how fast (or slow) continuation gaps close over time. After about a month, half the gaps remain open. After 6 months, some still remain open.

**Average gap size.** Downward gaps in bear markets are the tallest. I know that bear markets see price drop about twice as fast as it rises in bull markets, so I'm wondering if gaps help that process.

**Gap position.** I measured where in the price trend the gap continuation gap appeared. The median gap location from the trend start to the end of the trend is about midway, regardless of market conditions (bull or bear) and gap direction (up or down). I was surprised by this, but pleased, too. I like to see consistent results across different conditions.
