in Figure 2-7. If that resistance is penetrated, the S&P will reach the parallel channel line in Figure 8-2, which lies in the 630s-650s range in the second half of 1995. This line corresponds to that for the Dow shown in Figure 2-5. The NYSE index (not shown) is a carbon copy of the S&P. By the way, do not bother to extend the lower support line dating from 1942. Its significance ended in 1974 when wave IV ended. There is no effective support line to be drawn except the one shown for the Dow at Millennium degree in Figure 5-4.
