Table 33.11 Special Features

Trading Tactic	Performance
Small top-to-top variation	14%
Large variation	18%
Median top-to-top variation	1%
Lower left top	16%
Lower right top	16%

- Sometimes price will bottom in an irregular fashion (before the first Eve peak) with several valleys touching an up-sloping trend. Connect those valleys with a trendline. That's your target. This works with a loose-looking up-and-down movement that's quite wavy but seems to bottom along the trendline. That trendline, extended into the future, is a support area where the stock will drop and reverse. This setup is rare, but I've seen price hit the trendline and reverse there.

Table 33.11 shows special features for double tops.

Top-to-top variation. Patterns in bull markets show better performance when the price variation between the highest high in each top is larger than the 1% median. The difference between the two is large enough that you might want to pay attention to this idea.

Lower top. I didn't see any performance improvement in this measure. I checked to see if performance changed depending on which top of the double top was lower.

Sample Trade

Figure 33.5 shows the sample trade for Eve & Eve double tops. In a bull market, after a double top, price soars 60% after reaching the ultimate low (as I've mentioned). Even if you are late calling the turn, you can still make a profit. Consider the Eve & Eve double top shown in the figure.
