wedding dowry. But here is the thing: It has done this since time immemorial. That is why it is *already reflected* in gold's price. The key for asset price movement is not the historical buyer already reflected in the market, but rather, the *next marginal* buyer that is not yet incorporated in prices.

- **Why invest?** An important yet overlooked part of the investing process is this simple question: Toward what aims and goals are you deploying your capital? Excuse my Financial Planning 101 talk, but depending upon the answer, there is a specific and appropriate level of risk commensurate with your goals. It is challenging to imagine having 50% of your net worth in any single investment. Note that founders such as Bill Gates, Steve Jobs, Jeff Bezos, Elon Musk, and Warren Buffett let their sweat equity ride while they spent decades building the companies for which they are known. Is that what is happening here? Could be. Or maybe he is just:
- **Talking his book**: Be skeptical when anyone is out promoting an investment they already made. We don't know if Sawiris was merely hyping the extensive holdings in gold and gold miners he already owned. In 2017, he launched a "new investment vehicle to acquire gold-mining assets across the world, expanding on the nearly $1.5bn of assets he owns in the sector," according to the *Financial Times*.[266]

This sort of investment leads to an obvious question: Why? Why do this, when you already have $6 billion: *You have already won*! Why put so much of that at risk with a hyper-concentrated bet? Because you have a feeling THIS asset class might do better than THAT one?

Ignore the outcome of this bet for a moment and consider the process. It is intensely concentrated, unnecessarily risky, and serves no understandable purpose. Even if he is correct in the forecast, so what? The risk outweighs any potential reward.
