bear markets, the value in the table is below the average for other chart pattern types.

Table 67.3 shows failure rates for triple bottoms. The rates start small if you consider 13% as “small,” but climb rapidly. For example, 13% of triple bottoms in bull markets fail to see price rise more than 5%. This figure doubles to 26% failing to rise more than 10% and almost triples (to 35%) the breakeven rate for a maximum price rise of 15%.

Notice that the bull market failures are smaller than the bear market ones, which is further evidence that you should avoid trading triple bottoms in bear markets.

Table 67.4 shows breakout-related statistics.

Breakout direction. The breakout is upward all of the time from a triple bottom by definition. A breakout happens when price closes above the tallest peak between the three bottoms. If price closes below the lowest valley in the pattern first, then it's not a triple bottom.

Yearly position, performance. Here's one of those head-scratchers. In bull markets the best performance comes from patterns with breakouts within a third of the yearly high. As the breakout price rises (from the lowest third to the highest third), performance improves.
