leading to the start of the inverted roof. Figure 54.1 shows a downward inbound trend. If the price trend is downward, check for a left and right shoulder followed by an upward breakout. If you find all of that, then it's a head-and-shoulders bottom and not an inverted roof.

For upward inbound price trends, don't worry about searching for shoulders. Even if it has them, it's not a head-and-shoulders bottom.

Symmetrical. The two halves of the V-shape should be similar in size and shape. It should *look* like the bottom half of a diamond. Price should touch the trendlines multiple times, but often this is a function of how you draw the trendlines.

Volume. This (Figure 54.2) inverted roof has upward trending volume, and that is unusual. Most of the time (65% to 70%) volume will trend downward from the start of the pattern to the day before the breakout.

Breakout direction. There is no defined breakout direction for the inverted roof, meaning the breakout can be in any direction. In fact, it's about random, with 51% favoring the upward direction.
