

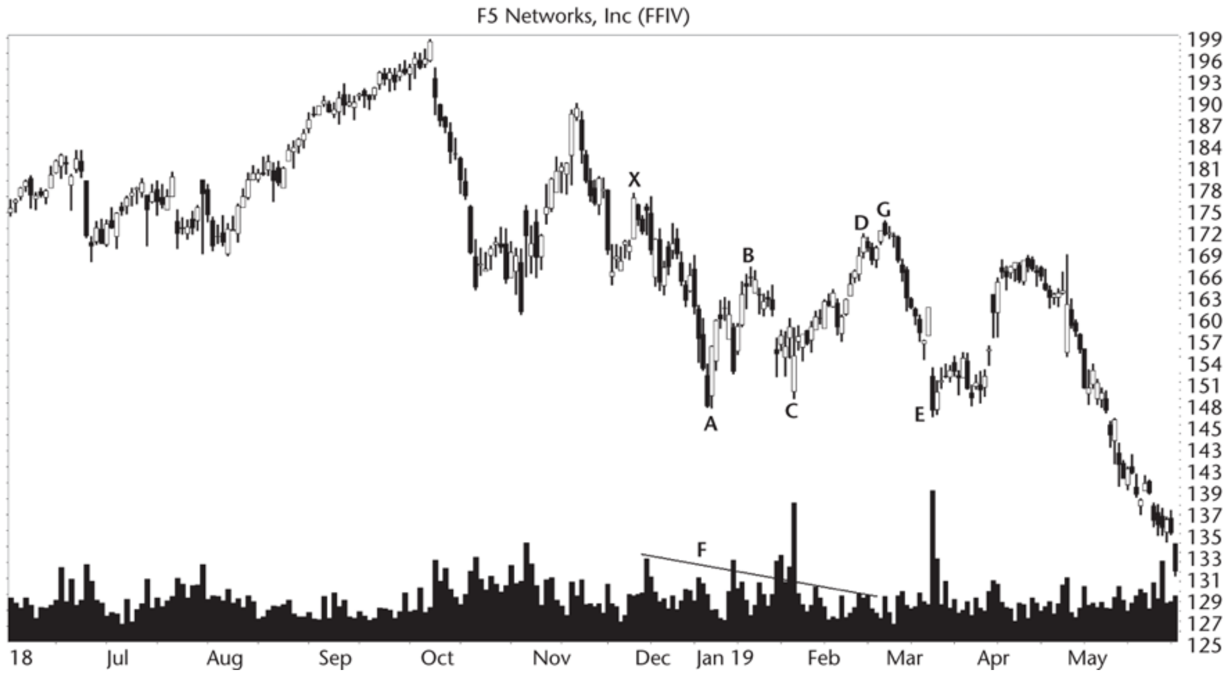

**Figure 37.2** The bearish Gartley is at XABCD. Notice the minor dip after D and climb to G.

The calculated D turn is at 168.45 for this pattern, so the stock overshot that price. Thus, if you went through the math and placed an order to short before checking if the stock actually turned there, you were making a mistake. I can't image anyone doing that, but you never know.

Volume in this Gartley is typical for the pattern (a downward trend).

**Appearance.** The pattern is named after its founder, H. M. Gartley. It looks like a big W with unequal bottoms, a pattern I call an ugly double bottom. I don't discuss ugly patterns in this book, but my website (ThePatternSite.com) has some details on a few patterns in case you're interested (look for *Ugly patterns* on the home page).

The bearish Gartley is a five-turn pattern with several of the turns obeying Fibonacci numbers; at least modern versions of the pattern apply numbers to the turns. Depending on which source you check, the numbers may vary from source to source as I mentioned. Table 37.1 shows the ones I used.

Your pattern recognition software may use a different method and different Fibonacci numbers to qualify the bearish Gartley. Here's how I identify the various turns in the pattern.
