As you scan down the table, notice that the performance difference is minor, regardless of which category you are looking at. Thus, volume is not a good predictor of performance of the icup, at least for the samples I used in the study. Bear markets show no performance difference at all.

Volume trend. Volume trends downward most often, but the results are about random. Don't throw away a pattern just because volume trends upward.

Rising/Falling volume. Patterns with falling volume in bull markets tend to see price decline a bit more than for their rising-volume counterparts.

Breakout day volume. Light breakout day volume helps performance (bull market only), but the performance boost is negligible. Market lore says heavy breakout day volume helps performance, but we don't see that here, nor in some other chart pattern types.

Table 22.7 shows how often price reaches a stop location. You can use these numbers to help locate where a stop-loss order should be placed to protect profit and limit losses.

Table 22.6 Volume Statistics

Description	Bull Market	Bear Market
Volume trend	52% down	53% down
Rising volume trend performance	–16%	–23%
Falling volume trend performance	–18%	–23%
Heavy breakout volume performance	–17%	–23%
Light breakout volume performance	–18%	–23%

Table 22.7 How Often Stops Hit

Description	Bull Market	Bear Market
Pattern top	0%	0%
Middle	9%	3%
Pattern bottom	78%	72%
Handle high	11%	6%
