

- 

2. Implement functions to:

- Calculate the total portfolio value
- Calculate the allocation percentages by asset class and sector
- Identify the best and worst performing securities
- Generate a report of positions that are up or down more than 5%

3. Use appropriate data structures:

- Dictionaries for storing the portfolio and security information
- Lists for tracking purchase history or price changes
- Tuples for storing fixed information like (ticker, asset\_class, sector)
- Sets to find overlaps between different groupings (profitable securities, securities in a particular sector, etc.)

4. Create a watchlist of potential securities to add to the portfolio and implement set operations to:

- Find securities in your watchlist that would complement your existing portfolio (not duplicate sectors)
- Identify which watchlist securities match your current holdings' sectors

5. Output a formatted summary showing portfolio diversification, performance metrics, and potential rebalancing needs.
