

- Dictionaries to organize all data by stock symbol and to store strategy parameters
- Sets to track which stocks generate signals under different strategies

5. Implement functions to:

- Find stocks that generate the same signal across multiple strategies (using set intersection)
- Identify stocks with contradictory signals (buy in one strategy, sell in another)
- Rank stocks by the "strength" of their signals (how many strategies agree)

6. Create a summary report that shows:

- Current signals for each stock under each strategy
- Stocks with consensus signals across multiple strategies
- Historical "hit rate" of each strategy (how often a signal led to a profitable move)
