

```

27. if len(prices) < slow_period:
28.     return False # Not enough data
29.
30. fast_ma = calculate_sma(prices, fast_period)
31. slow_ma = calculate_sma(prices, slow_period)
32.
33. # Check if fast MA is above slow MA now
34. current_condition = fast_ma > slow_ma
35.
36. # Get previous day's prices
37. previous_prices = prices[:-1]
38.
39. previous_fast_ma = calculate_sma(previous_prices, fast_period)
40. previous_slow_ma = calculate_sma(previous_prices, slow_period)
41.
42. # Check if fast MA was below slow MA previously
43. previous_condition = previous_fast_ma <= previous_slow_ma
44.
45. # Golden cross occurs when fast MA crosses above slow MA
46. return current_condition and previous_condition
47.
48. # risk.py - Risk management functions
49.
50. def calculate_position_size(account_value, risk_percent, entry_price, stop_price):
51.     """Calculate position size based on fixed percentage risk"""
52.     # Implementation as shown earlier
53.     pass

```

With this library structure, you can import and use these functions in your trading scripts:

Import functions from your library

```

1. from indicators import calculate_rsi, calculate_sma
2. from signals import check_golden_cross
3. from risk import calculate_position_size
4.

```

Use them in your trading strategy

```

1. prices = [100, 102, 99, 101, 103, 102, 105]
2. rsi = calculate_rsi(prices)

```
