

5. Document each function with clear docstrings that explain:

- What the function does
- Parameters it accepts
- Return values
- Example usage

This project will give you experience creating a professional trading function library similar to those used in quantitative trading firms, while reinforcing proper function design, parameter handling, and documentation.

Project 8: Multi-Strategy Trading System

Objective: Create a trading system that combines multiple strategies to generate more robust trading decisions. This project demonstrates how functions enable you to build complex trading logic from simple, reusable components.

Requirements:

1. Implement at least three distinct trading strategy functions:

- `trend_following_strategy()`: Uses moving averages to identify trends
- `mean_reversion_strategy()`: Uses RSI or similar indicators to identify overbought/oversold conditions
- `breakout_strategy()`: Identifies when price breaks above resistance or below support levels
