

Handling Missing Values: Filling the Gaps

Missing data is common in financial datasets, often occurring due to:

- Market holidays
- Trading halts
- Data feed disruptions
- Corporate actions

Here's how to identify and handle missing values:

```
1. import yfinance as yf
2. import pandas as pd
3. import numpy as np
4.
5. # Download data
6. data = yf.download("AAPL", start="2023-01-01", end="2023-07-01")
7.
8. # Check for missing values
9. print("Missing values in each column:")
10. print(data.isna().sum())
11.
12. # Fill missing values - several approaches:
13.
14. # 1. Forward fill (use previous day's value)
15. data_ffill = data.ffmpeg()
16.
17. # 2. Backward fill (use next day's value)
18. data_bfill = data.bfill()
19.
20. # 3. Interpolation (estimate based on surrounding values)
21. data_interp = data.interpolate()
22.
```

The best approach depends on your specific situation:

-
