

```

67. # Example usage:
68. apple_data = get_clean_data("AAPL", "2022-01-01")
69.
70. # Quick visualization of the prepared data
71. if apple_data is not None:
72.     plt.figure(figsize=(12, 8))
73.
74.     # Price chart
75.     plt.subplot(3, 1, 1)
76.     plt.plot(apple_data['Adj Close'])
77.     plt.title('Apple Stock Price')
78.     plt.grid(True)
79.
80.     # Returns
81.     plt.subplot(3, 1, 2)
82.     plt.plot(apple_data['Returns'])
83.     plt.title('Daily Returns')
84.     plt.grid(True)
85.
86.     # Volatility
87.     plt.subplot(3, 1, 3)
88.     plt.plot(apple_data['Volatility'])
89.     plt.title('20-Day Volatility')
90.     plt.grid(True)
91.
92.     plt.tight_layout()
93.     plt.show()
94.

```

This code creates a reusable function that:

1.
Fetches data for any ticker symbol
2.
Handles missing values
3.
Adds useful derived columns (returns, volatility, relative volume)
