

```

8.
9.  # Calculate average gain and loss
10. avg_gain = gain.rolling(window=window).mean()
11. avg_loss = loss.rolling(window=window).mean()
12.
13. # Calculate RS (Relative Strength)
14. rs = avg_gain / avg_loss
15.
16. # Calculate RSI
17. rsi = 100 - (100 / (1 + rs))
18.
19. return rsi
20.
21. # Calculate 14-day RSI
22. apple['RSI14'] = calculate_rsi(apple['Close'], 14)
23.

```

The RSI is typically used with a 14-day period, though this can be adjusted based on trading preferences. The indicator oscillates between 0 and 100, with traditional interpretations suggesting:

- RSI > 70: Potentially overbought conditions (price may be due for a pullback)
