

Bollinger Bands are interpreted in several ways:

- **Price touching upper band:** Potentially overbought conditions
- **Price touching lower band:** Potentially oversold conditions
- **Bands squeezing together:** Low volatility, often preceding a significant move
- **Bands expanding:** High volatility, often during strong trends

Unlike fixed boundary indicators, Bollinger Bands adapt to changing market conditions, making them valuable across different market environments.

MACD: Trend Following and Momentum

The Moving Average Convergence Divergence (MACD) indicator, developed by Gerald Appel in the late 1970s, combines elements of trend
