

```

26. # Combine signals with trend filter
27. if trend == 1: # Uptrend
28.     if momentum == 1 or volatility == 1:
29.         signal = 1 # Buy signal in uptrend
30. elif trend == -1: # Downtrend
31.     if momentum == -1 or volatility == -1:
32.         signal = -1 # Sell signal in downtrend
33.
34. return signal
35.
36. # Apply combined strategy to each row
37. apple['Combined_Signal'] = apple.apply(combined_signal, axis=1)
38.

```

This approach:

1.
Identifies the overall trend using moving averages
2.
Checks momentum conditions using RSI
3.
Assesses volatility conditions using Bollinger Bands
4.
Generates a signal only when multiple conditions

align

Professional trading systems often use much more sophisticated combinations, weighting different indicators based on market conditions and historical performance.

Conclusion: The Art and Science of Technical Analysis

When Bruce Kovner, founder of Caxton Associates and one of the most successful traders in history, was asked about technical analysis, he famously said: "I've studied a lot of market history for technical knowledge, and that has been very useful. Technical analysis is extremely helpful in developing one's feel for the market."
