

- Assigns different weights to different indicators
- Creates a composite signal score for buy/sell decisions
- Implements a trend filter to avoid trading against the primary trend

5. Analyze signal effectiveness by:

- Calculating the success rate of each individual indicator
- Measuring the success rate of combined signals
- Comparing performance across different market conditions (trending vs. ranging)
- Identifying which indicators work best for which types of stocks

6. Create visualizations showing:

- Price charts with all indicators
- Signal points marked on the charts
- Success/failure rates of different indicators and combinations
- Equity curves assuming simple entry/exit based on signals

Project 14: Custom Indicator Development and Backtesting System

Objective: Design, implement, and test custom technical indicators that go beyond standard indicators, then evaluate their effectiveness in a backtesting framework.
