

```
28.     # Buy all available shares
29.     order_target_percent(context.asset, 1.0)
30. elif short_sma < long_sma:
31.     # Sell all shares
32.     order_target_percent(context.asset, 0.0)
33.
34.     # Record values for analysis
35.     record(short_sma=short_sma, long_sma=long_sma, price=data.current(context.asset, 'close'))
36.
```

Zipline is particularly strong for:

- Research workflows where you need to test many strategies
- Institutional-quality backtesting with realistic market frictions
- Strategies that trade many securities simultaneously
- Complex event-driven strategies

While Zipline has a steeper learning curve than Backtrader, its design principles reflect the requirements of professional trading firms, making it valuable for serious algorithmic traders.

Evaluating Performance Metrics

Beyond Profit and Loss: Professional Performance Measurement

While total returns are important, professional traders evaluate strategies using more sophisticated metrics that account for risk, consistency, and drawdowns. Let's explore the key performance metrics used by institutional algorithmic traders.

Sharpe Ratio: Risk-Adjusted Returns

The Sharpe Ratio, developed by Nobel laureate William Sharpe, is perhaps the most widely used performance metric in professional trading.
