

Setting Up Your First Trading Project

Now that you have all the components installed, let's put them together into your first trading project structure. This organization will help you maintain clean, professional-grade code as your strategies become more complex.

Creating a Project Directory Structure

Open your terminal or command prompt and run the following commands:

```
1. mkdir my_trading_project
2. cd my_trading_project
```

Now let's create a virtual environment for this project:

```
1. python -m venv venv
2.
3. # Activate the virtual environment:
4. # On Windows:
5. venv\\Scripts\\activate
6.
7. # On macOS/Linux:
8. source venv/bin/activate
9.
```

Setting Up a Basic Project Structure

Create the following structure for your project:

```
my_trading_project/
├── data/           # For storing market data
├── strategies/     # Trading strategy implementations
├── backtesting/    # Backtesting scripts
├── analysis/       # Analysis notebooks
├── utils/          # Utility functions
└── requirements.txt # Library dependencies
```

You can create these directories with the following commands:

```
mkdir data strategies backtesting analysis utils
```
