

Create an `environment.md` file in your project describing:

- Python version
- Key library versions
- Installation instructions
- Known issues or dependencies

## Version Control for Code and Environment

Use Git to track not just your code but also your environment files:

1. #Initialize a Git repository:
2. `git init`
- 3.
4. #Create a `.gitignore` file to exclude unnecessary files:
5. # `.gitignore`
6. `venv/`
7. `__pycache__/`
8. `data/*.csv`
- 9.
10. Add and commit your files:
11. `git add .`
12. `git commit -m "Initial project setup"`
- 13.

## Troubleshooting Common Setup Issues

Even with careful setup, you might encounter issues. Here are solutions to common problems:

### Python Not Found After Installation

If you get "command not found" errors when trying to run Python:

1.  
**Check your PATH:** Ensure Python was added to your system PATH
- 2.
