

Arithmetic Operators: Calculating Numbers

These operators perform basic mathematical operations:

- + **Addition:** `total = price + commission`
- - **Subtraction:** `profit = selling_price - purchase_price`
- * **Multiplication:** `position_value = price * shares`
- / **Division:** `per_share = total_dividend / share_count`
- // **Integer Division (discards remainder):** `whole_lots = shares // lot_size`
- % **Modulo (remainder after division):** `remaining_shares = shares % lot_size`
- * **Exponentiation (power):** `compound_return = (1 + monthly_return) ** 12`

Let's see these in action with a simple profit calculation:

```
1. # Initial investment
2. purchase_price = 100.00
3. shares_bought = 50
4.
5. # Selling conditions
6. selling_price = 125.75
7. commission_rate = 0.01 # 1%
8.
9. # Calculate total investment
10. total_investment = purchase_price * shares_bought
11.
12. # Calculate sale value and commission
13. sale_value = selling_price * shares_bought
14. commission = sale_value * commission_rate
15.
16. # Calculate profit
17. profit = sale_value - commission - total_investment
18.
```
