

# Building Your Own Trading Logic: A Step-by-Step Approach

Now that you understand the fundamental control flow structures, here's a systematic approach to building your own trading logic:

1.

## **Define your trading rules clearly**

- What market conditions trigger entry?
- What conditions trigger exit?
- Are there special cases to handle?

2.

## **Translate rules to conditional statements**

- Use `if/elif/else` to codify decision points
- Combine conditions with `and/or` for complex rules

3.

## **Implement repetitive analysis using loops**

- Use `for` loops for known iterations (e.g., analyzing each stock)
- Use `while` loops for condition-based repetition (e.g., waiting for threshold)

4.

## **Test with historical data**

- Run your logic through past market scenarios
- Verify it behaves as expected in different conditions

5.

## **Refine and optimize**
