

Not yet.

Truth be told, the super fund you're in now—that is, the company managing the money—is probably is a little . . . Jean-Claude Van Damme (google him), rather than The Rock.

See, when you joined your job you probably got enrolled in a 'default' fund. There are two issues with that.

The first is the fees are probably too high—which will burn you big time.

The second is that your fund has probably placed you smack-bang into its 'balanced' investment option.

That means the fund will invest your money exactly the same as for every other employee at your workplace—including that old guy Warren (age 59), who plans on retiring in a few years' time.

But for a young person like you, a default fund makes as much sense as sharing your wardrobe with your parents. (Sure, it sounds fun, until you see your mum trying to squeeze into your boob tube.)

Default funds are designed for people of every age. They have around 75 per cent in shares (to grow your money) and around 25 per cent in cash and fixed investments (which is a 'safety net' for the likes of Warren, because shares can be volatile in the short term).

You don't need what Warren does—after all, you have the best safety net of all: *time*.

My advice?

You should be investing every last dollar of your super—100 per cent—into the greatest wealth-building machine ever created: the share market.

Look, the Barefoot Ten has been about lifting your financial confidence.

You're now financially smarter than half the adults you see walking about (including some of your teachers). I'm being deadly serious here: studies show that more than half the adult population don't have the numeracy skills to function on a day-to-day level.
