

# Market Movements

*Joseph E. Granville*

There are very few “accidents” in the stock market. When a stock advances or declines there is a “reason” behind the move. It is not the primary concern of a market technician to determine what the reason is, the assumption being that there is always a reason. The technician is primarily concerned with timing, *when* a stock moves rather than *why* it moves. Since there cannot be any motion without the presence of some kind of energy, a study of stock price movements prompts an investigation of some of the forces behind these movements and this leads us into a brief discussion of simple physics.

---

*Johann Sebastian Bach . . . could have been a great stock market technician if he were alive today.*

---

Stock price movements often show a tendency to adhere to some physical laws. You have been introduced to some basic concepts and now it is time to add some refinements, relating the *breakout*, the *flatbase breakout*, *support* and *resistance*, *gaps* and *climactic moves* to the laws of motion. It will be
