

illustrated that stocks tend to develop their own "rhythm" and back and fill with a tendency to respond to some of the mathematics of melody and music. You will be shown that the effectiveness of great art is as much a matter of timing as it is construction.

BACH, BEETHOVEN AND KOSMA

There is a predictable order in the universe. All motion is governed by *laws* of motion. There are no accidents. All vacuums are filled. Bodies in motion tend to remain in motion. Bodies at rest tend to remain at rest. You have already seen some of these laws at work in reading a stock price chart. An advance follows an upside breakout. A decline follows a downside breakout. A failure to reach a previous peak leads to a decline. All gaps are filled. All these movements are based on universal laws of motion. They not only apply to the stock market but they equally apply to laws of physics, medicine and mathematics as well as to music.

JESU, JOY OF MAN'S DESIRING

Johann Sebastian Bach, who was born in 1685 and died in 1760, could have been a great stock market technician if he were alive today. His great music *followed every technical principle of stock market analysis*. He might be today a stock price chart reader *par excellence*. Of course Bach was remotely removed in terms of time and temperament from the modern day stock market. However, his music consciously or unconsciously *follows the direction forecasted by the very notes themselves*. Bach was inspired and yet his music almost fits a *mathematical* formula.

Below is written the theme of Bach's "Jesu, Joy of Man's Desiring".
