

pull gradually lessens until we gain an easier upside momentum. When enough energy has been expended on the upside then exhaustion wins out and the body returns to earth. It is this way with stocks. This is why a stock will stay in a base area (Phase One) for awhile until enough upside energy (volume buildup) has been generated to overcome the pull of gravity or price inertia. When this takes place the stock moves into the second phase of advance. Upside energy keeps building up until it accelerates the price into the rapid Third Phase and here the *balance* of the upside energy is *expended* and then the stock has nothing left to *fuel* the rise any further and then the laws of gravity once again *predominate*. In other words, it takes energy to overcome gravity. Of course there is nothing new here but these things should be thought of when it comes to stocks.

A stock can fall more quickly than it rises by merely the turning off of the faucet of upside energy leaving nothing left except the natural law of gravity to predominate. It was there all the time but it took constant upside energy exerted to overcome it. Remove it and the price would have to fall of its own accord.

5. *There Are No Vacuums in Nature.*

Nothing happens without a reason. In nature there is reason and nature wasteth not. Therefore, vacuums are waste and thus there are no vacuums in nature. Being UN-natural, they are thus *filled*. All natural phenomena can be reduced to ENERGY and nature fills vacuums with energy. We have seen the gaps filled between notes in the music of Bach, Beethoven and Kosma and in technical stock analysis we can also say that the *natural* laws of vacuum-filling are fulfilled.
