

groups dominated the charts during the final phase of advance in the Dow Jones Industrials from 1962 to 1966.

*The 'Thirties bear years brought hard-time
laments and mellow ballroom dance music.
With the mid-'Thirties bull market came
free-wheeling swing music . . .*

Suddenly, in 1966, the Rolling Stones outdid the Beatles in Top 10 hits, with themes of drugs, mental breakdown, crying and deaths; the Stones' final hit of the year was in October. Look at the crash in stock prices from January to October 1966 and see how precisely it reflected the new mass mood. By mid-1966, says Philip Norman in *Shout!*, "The latter-day Mersey [i.e., happy-mood English] groups had all gone home to settle down as pork butchers and damp course engineers." The same thing happened to other happy-music bands who failed to change musical direction: their strings of Top 10 hits were snapped abruptly in 1966.

The public was now looking for something else. It found that something else in more "worldly" lyrics and musical accompaniment increasingly involving "distortion," or noise. Coincidentally, the name for rhythmic popular music changed, from "rock and roll" to just plain "rock," a name that correctly suggested the hardness of the new musical style. "Blues" music, which had fallen from popularity in the early 'Fifties, resurfaced as a dominant style.

The mood mixture in popular music between 1966 and 1969 remarkably reflected the bull market/bear market battle that was raging on Wall Street. The secondary indexes were heading for new highs, but the Dow Industrials, which had made their top in January 1966, were already declining. Meanwhile, rock music became consciously artistic, and flowered in terms of innovation, creativity, subtlety and complexity.
