

traditional bank so you decide to wait a whole ten years before checking
.how much your money has accumulated

Do you know how much your £50,000 would be worth after waiting for a
?decade

!Equivalent to approximately £35,000

How so? Because as the cost of living goes up while the money stays the
.same, the money shrinks, it depreciates in value

Let me give an example of this. Twenty years ago, if you were a millionaire
it was a massive achievement. You were considered rich. Today, everybody
seems to be a millionaire; it's no big deal. The reason is because £1 million
today is worth a lot less than it was twenty or even ten years ago. In the
very same way, your money in the bank is worth less month by month, year
.by year

Property makes you rich

Let's now imagine you invested that same £50,000 into a house. We know
that typically houses double in value every ten years or so, so after ten years
!your £50,000 should be worth around £100,000 right? Actually, no

Unless you bought the house for cash, the £50,000 would typically be the
deposit on the house. A £50,000 deposit should easily get you a buy-to-let
.property worth £200,000

What doubles? The deposit money or the value of the house? The answer is
that the value of the house doubles. So your £50,000 has now become
