

Text Functions

While most Excel work involves numbers, dealing with text data using string functions is essential, especially when cleaning and preparing data. Some key text functions are:

LEN(): Returns the length of a specified text string

TRIM(): Removes extra spaces before and after the text

PROPER(): Capitalizes the first letter of every word in the text

SUBSTITUTE(): Replaces parts of the specified text with a new text

CONCATENATE(): Joins together two or more text strings into one

FIND() and SEARCH(): Locates the position of some text within a string

UPPER() and LOWER(): Converts entire text string to upper or lower case

LEFT(), RIGHT(), MID(): Extracts portions from the left, right or middle of a text string

Beyond basic operations, mastering logical operations on text using functions like FIND, SUBSTITUTE, etc., is very useful.
