

## What are Macros?

Macros are essentially programming code that can automate routine processes and calculations in Excel. They allow recording a series of manual steps and keystrokes and then replaying them precisely with a single instruction.

Instead of repeating the same sequence of actions across multiple workbooks or datasets, macros let you create a reusable automation script to do that. This saves significant time and effort while also minimising human error.

Now, simply perform all the sequences of actions and steps that need to be automated. These could include typing data, formatting cells, running formulas, creating charts/visuals, etc.

### STEP 5

Once done, go back to the code group and click Stop Recording

That's it! The entire process of **recording the macro is complete.**

Anything done within those steps has been translated into behind-the-scenes programming code instructions.
