

Running Macros

After recording a new macro, there are several ways to run or replay it:

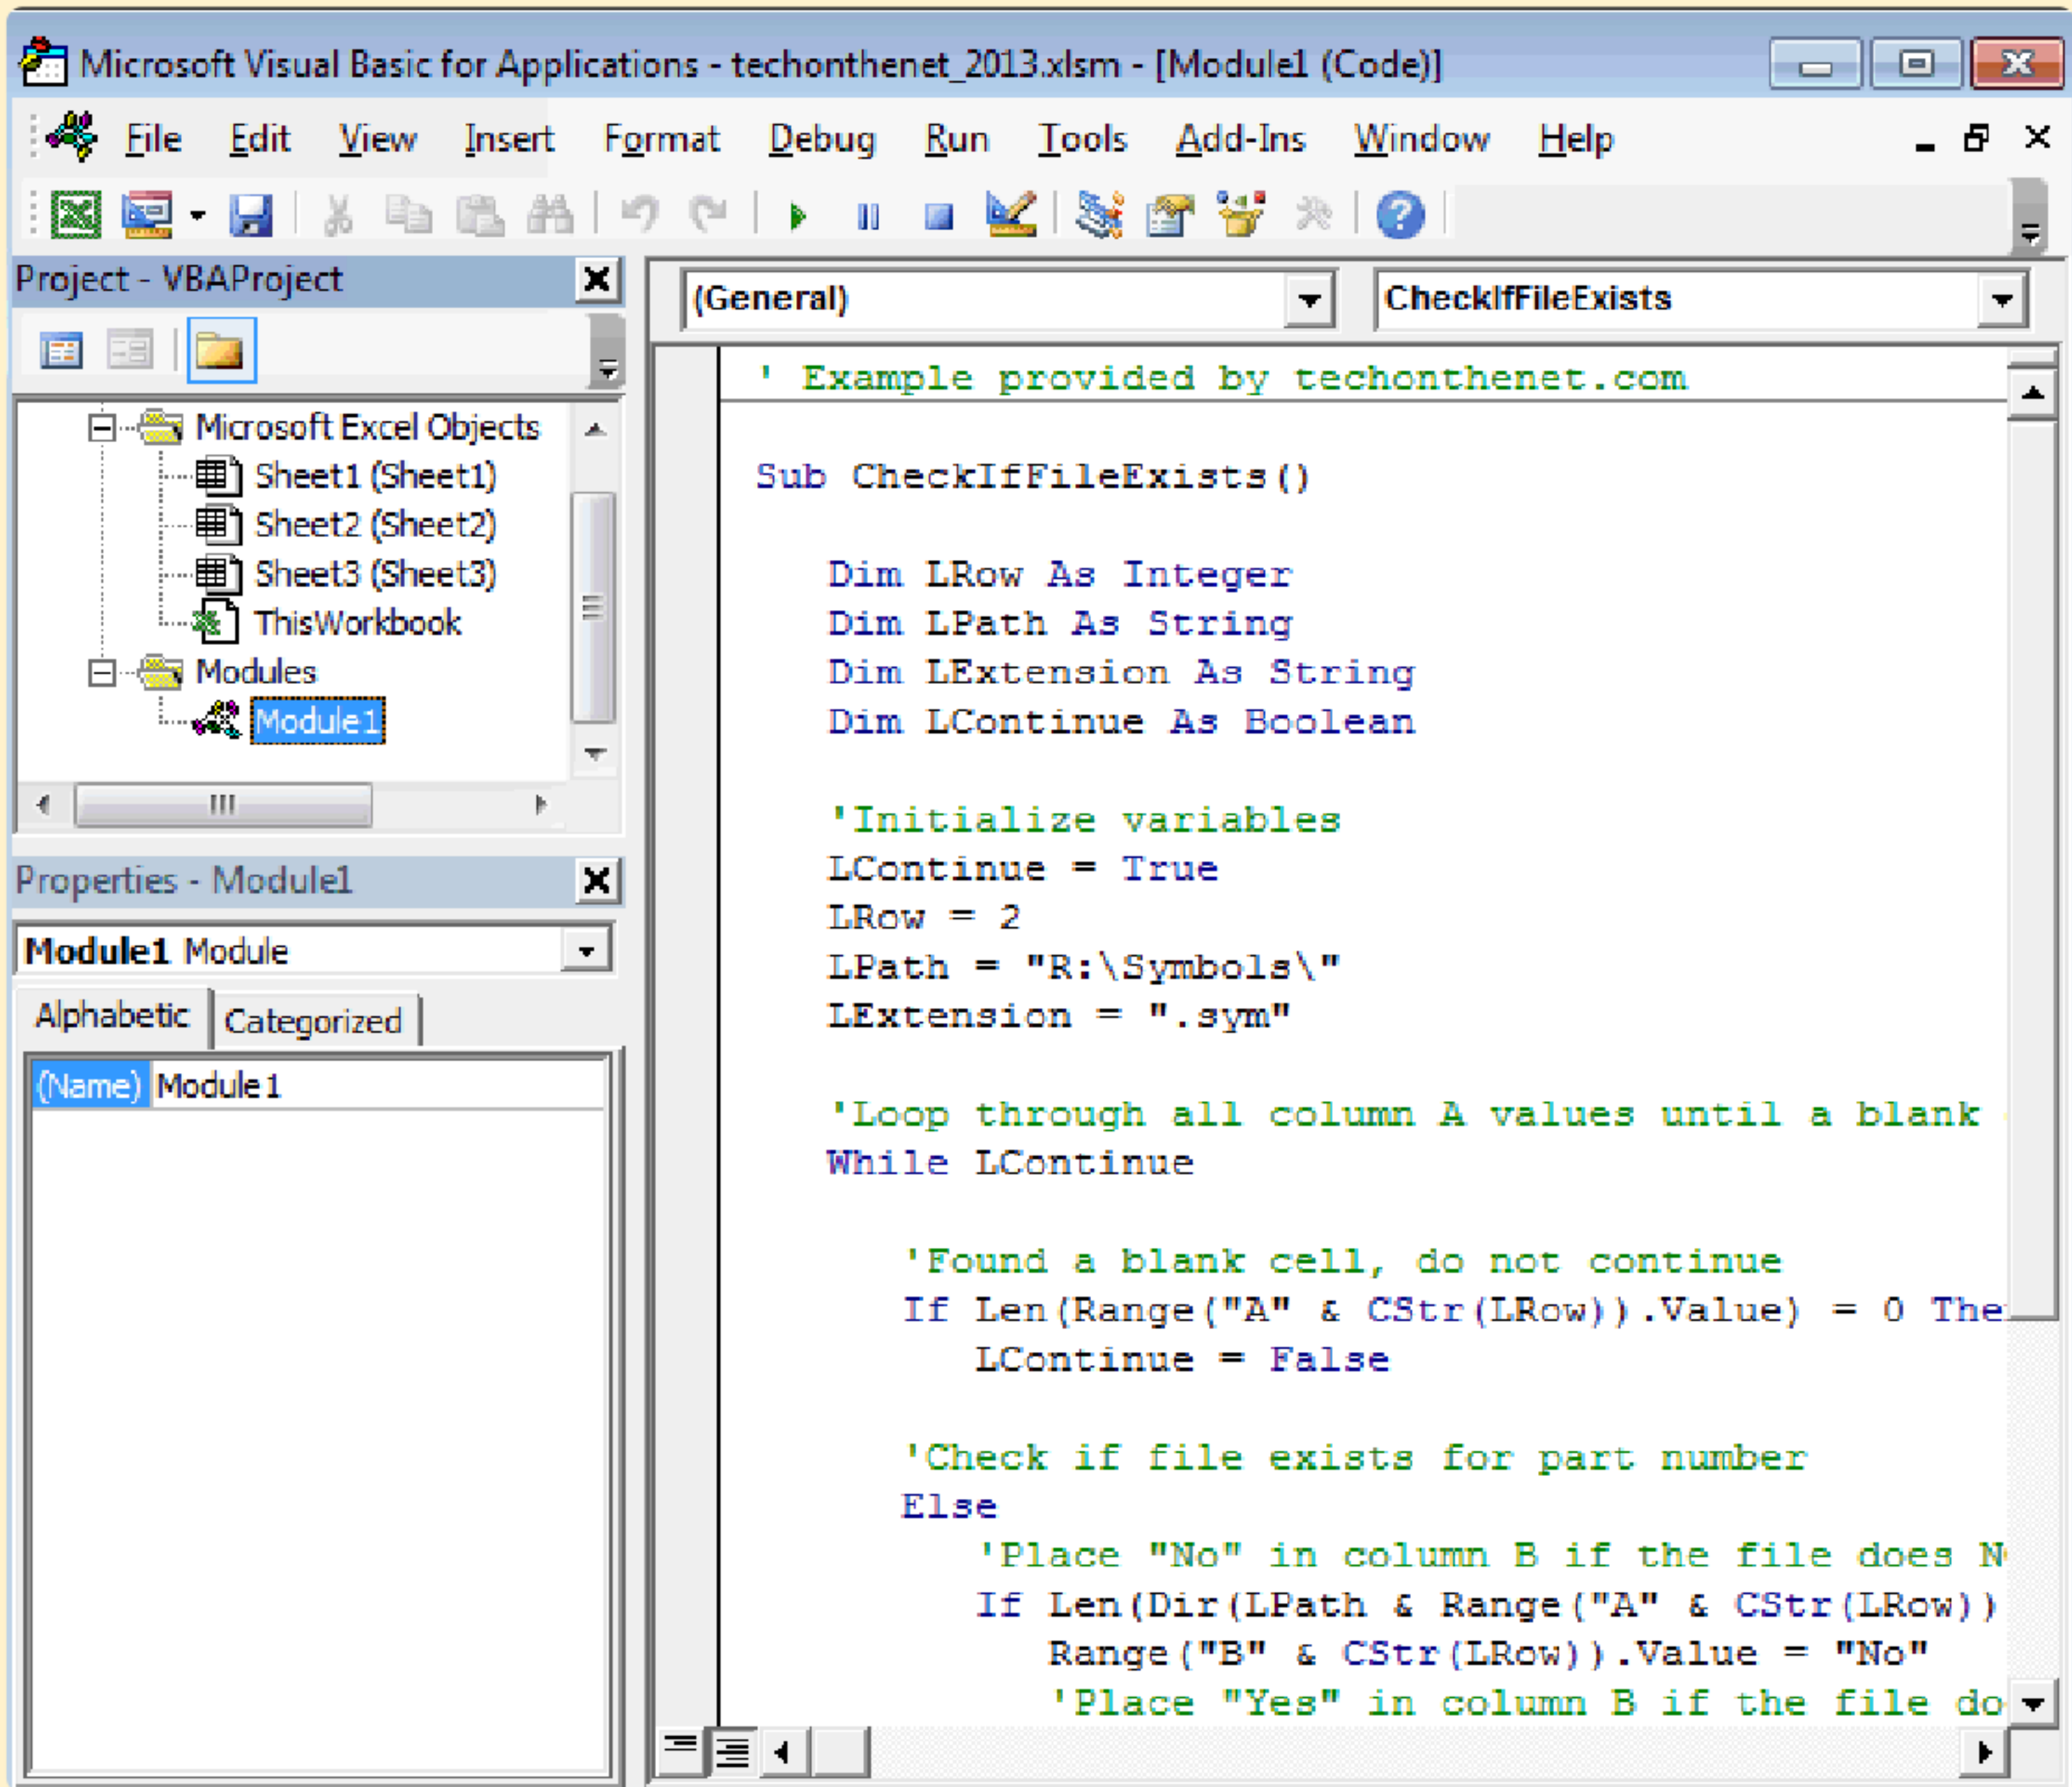

Use the Developer > Macros option to select and run the macro

1

Use the assigned keyboard shortcut to run the macro instantly

2

When executing the macro, all the sequences of steps recorded initially will now be carried out across any data in the workbook automatically at exceptional speed.

Editing and Writing Macros

While recording macros is very simple, sometimes customising or writing macros from scratch is required using VBA (Visual Basic for Applications), the programming language and environment in Excel for macro development.

Use Cases for Automation

Some everyday use cases where automation using Excel macros can hugely benefit consultants include:

Data Cleanup and Transformation

Import data from external sources in different formats, standardise it using functions/rules, and restructure and reorganise data automatically into ready-to-use templates.

Report Updates and Mail Merges

Automatically pull the latest data from sources into pre-built Excel report templates with charts, format and distribute reports on schedule.

Analytics and Model Building

Run routine data analysis/simulations over updated data sources, automate deriving key metrics/results, and compare with benchmarks.
