Create a dedicated button on the Ribbon to run the macro easily

VBA provides extensive functionality and commands to control everything in Excel programmatically - from manipulating data and ranges to creating visuals to interacting with other MS Office applications.

Here's an example of a basic VBA macro code to automate formatting the font and colour of a range of cells:

```
Sub HighlightRange() Dim rng As Range Set rng = Application.InputBox("Select a range", Type:=8) rng.Font.Bold = True rng.Font.ColorIndex = 3 End Sub
```

While learning VBA itself has a learning curve, modern code recording and editing tools in Excel aim to provide a more user-friendly experience

Presentation Deck Creation

Streamline the process of creating final model output slides and visualisations for PowerPoint presentations in a consistent branded format.

In addition to macros, newer features like **Power Query** enable advanced data transformations, merging, and automation using a more visual interface.

The key advantage of automating and programming such repetitive analytical tasks in Excel is immense time savings. Instead of repeating manual steps, consultants can develop automated routines to do that accurately and rapidly. This frees them to focus on higher-value activities like insight derivation, solution development, and client discussions.
