

Synthesis through Data Manipulation

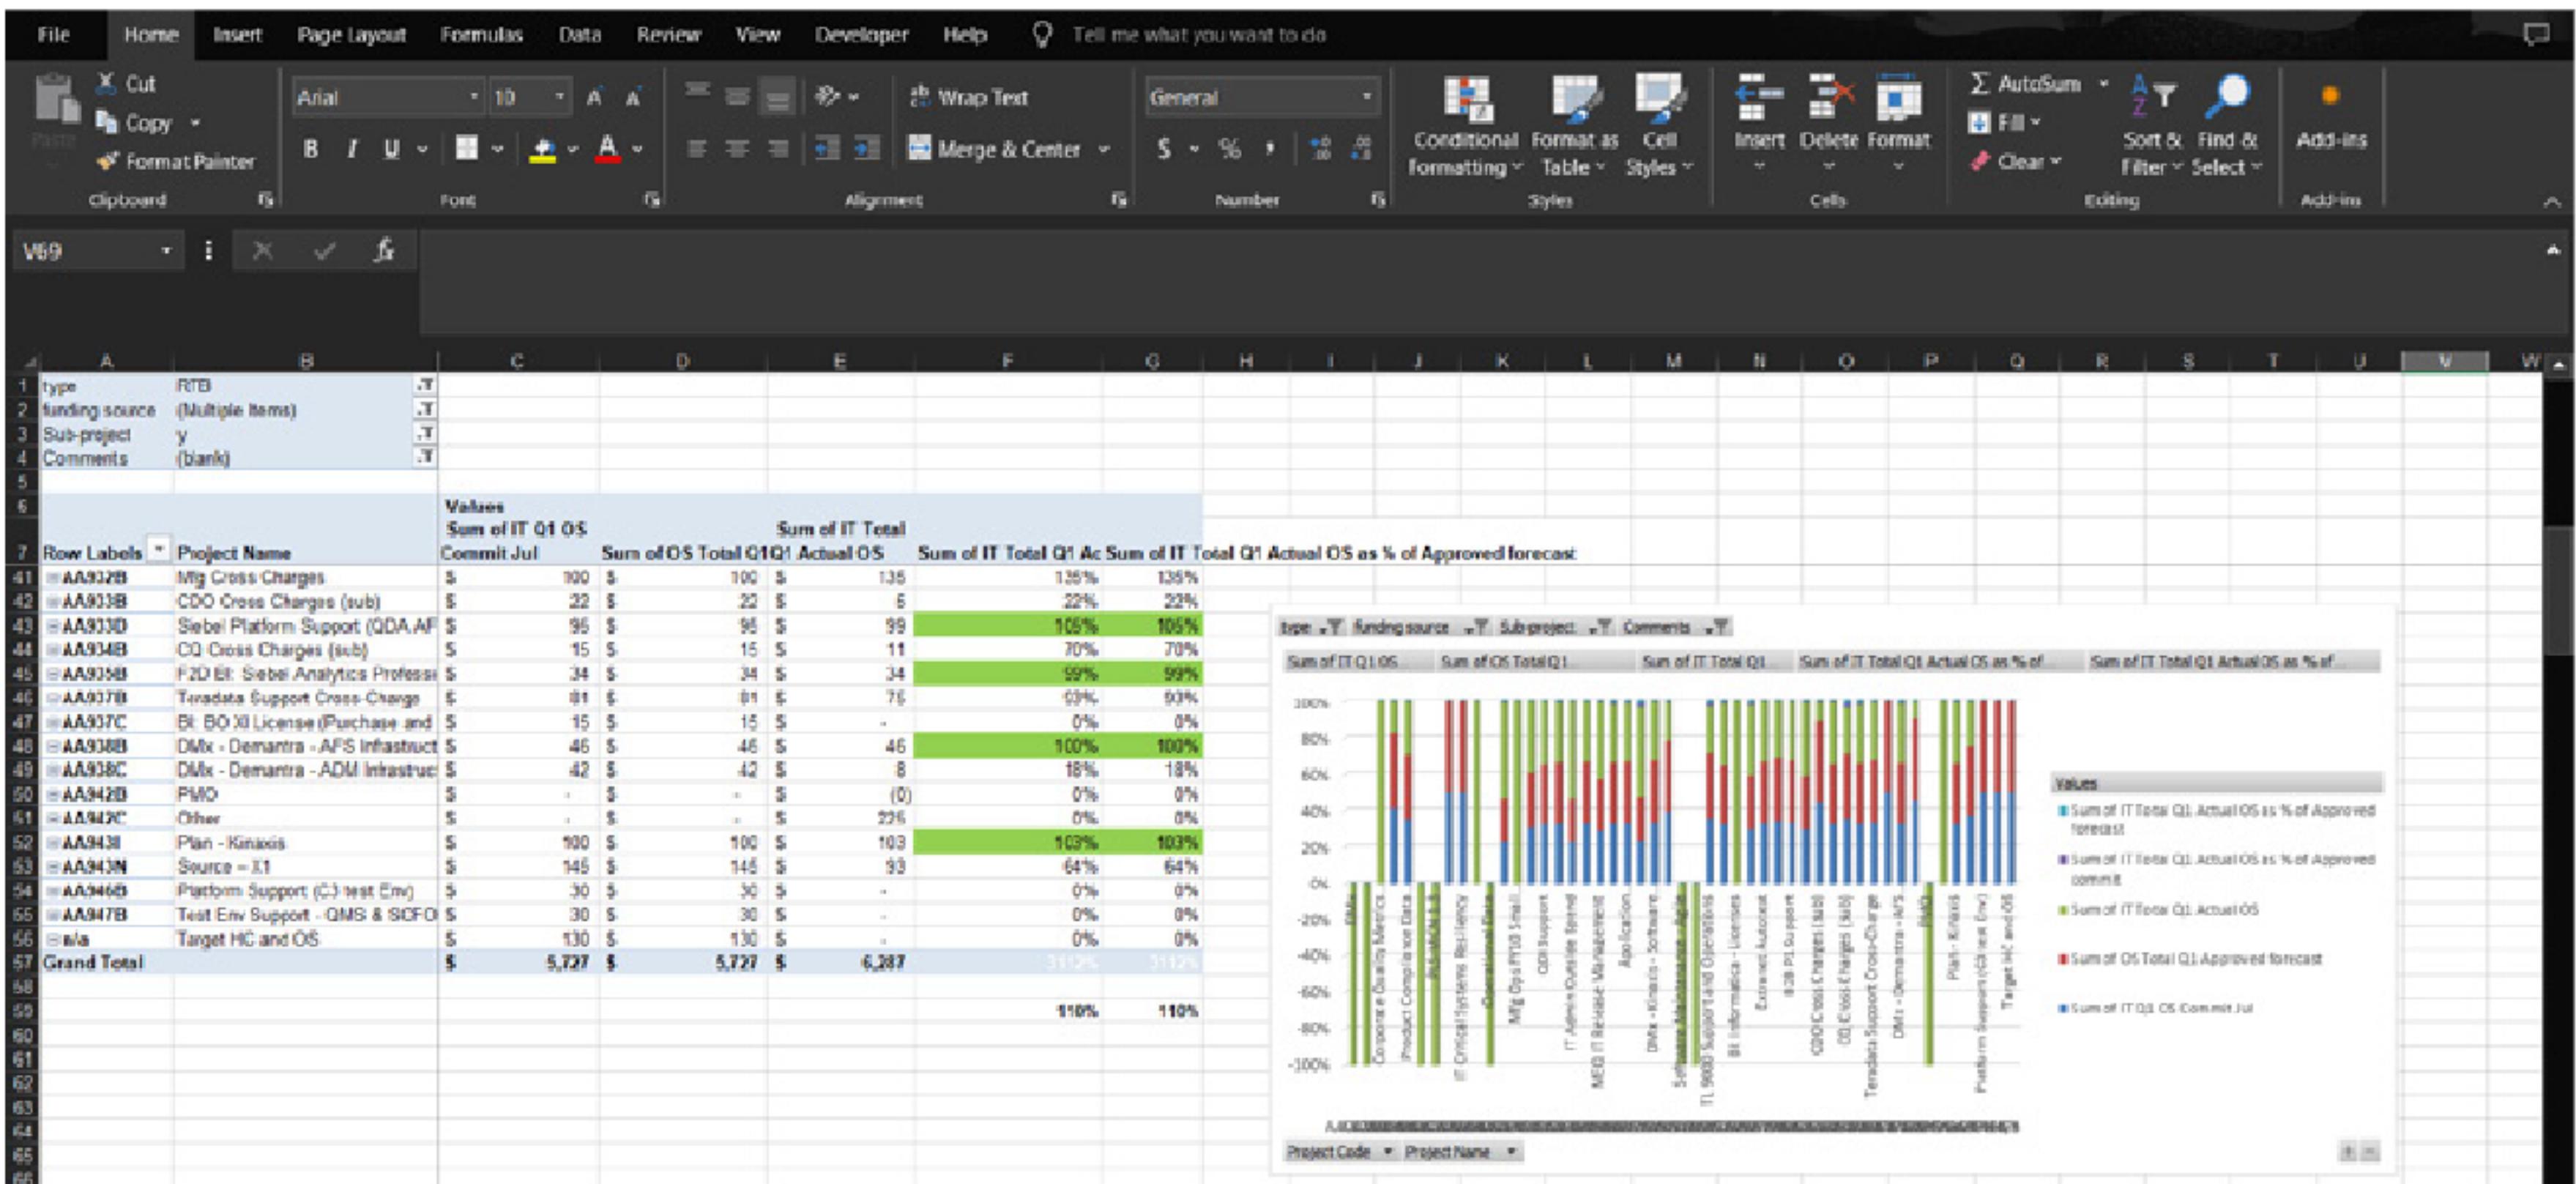

To analyse and synthesise the qualitative and quantitative data together, various steps using Excel functions and tools were performed:

Used text functions like **TRIM**, **CLEAN**, etc., to standardise and clean unstructured text data from sources like focus groups

Assigned codes and created pivot tables to categorise and quantify qualitative responses on product interests, pricing perceptions, etc.

Combined numeric data from surveys with categorised qualitative inputs using **VLOOKUP**, **INDEX-MATCH** functions

Created visual distributions, knee charts, etc., to map qualitative responses to quantitative patterns

Used Conditional Formatting to identify correlations, outliers and insights easily

This allowed for the synthesis of insights such as: “While survey data alone suggests X product concept has high interest, mapping the qualitative Voice of Customer indicates it lacks a unique differentiation angle.”
