

Interactive What-If Analysis

With the consolidated database and insights, we have built an interactive model to evaluate various product go-to-market scenarios. This utilised:

Data validation lists to enable selecting different formulation, pricing and marketing spend options

Lookups to pull in revenue goals, cost structures, and ramp-up curves depending on options selected

Simulating best case, worst case, headroom scenarios using nested IF, IFERROR conditions in formulae

Automating report outputs with Model vs. Achieved scorecards through simple VBA

Using this interactive model, we could calibrate the optimal viable product launch strategy to satisfy consumer needs and business goals through iterative what-if scenario evaluations.
